

Speed

Distance

(outer Scale)

60

=

Time

(inner scale)

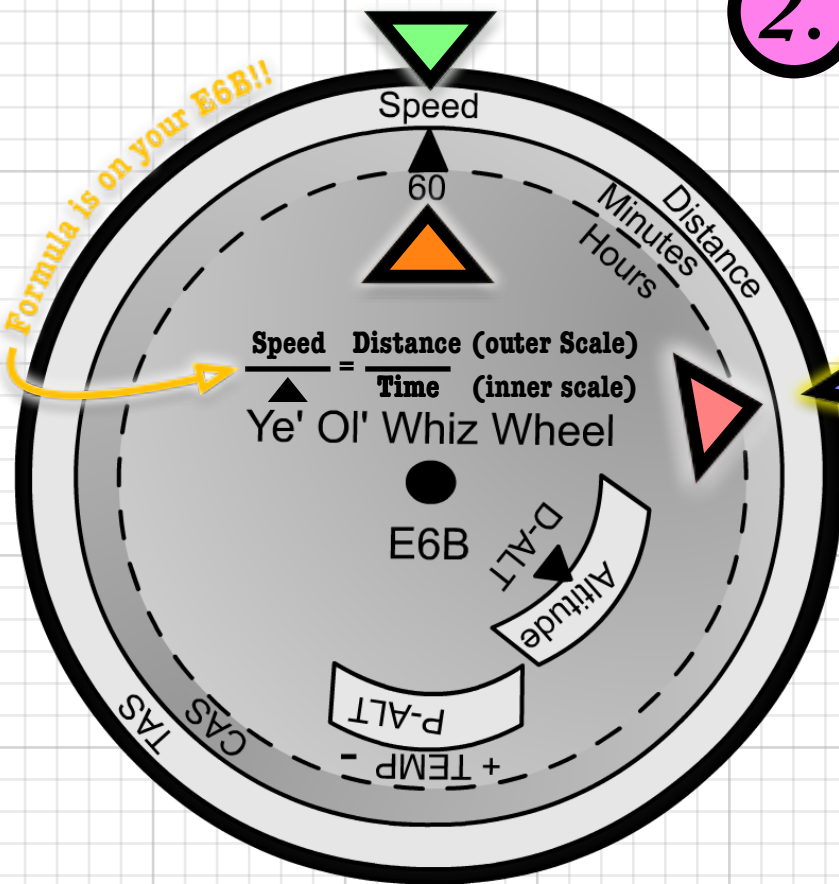

How far have I traveled?

How fast are you traveling?

How long have you been traveling?

1. Set Speed over the "Index" (60)

2. Read Distance over Time

Time can be referenced using Minutes or Hours & Minutes by reading the inner-inner scale

On the E6-B, numbers can represent different factors of 10. For example, "20" can represent 20, 2, 200, 0.2... Etc.

As a self check: If Time is greater than an Hour, then Distance will be greater than Speed.

Be sure to check the scale in-between numbers as it changes.
